Abstract

In this paper it is argued that the use of methods of computational linguistics can significantly contribute to teaching Modern Greek and particularly how to improve the writing skill. The target group of this research were the students of the science direction of secondary schools and the students of science in tertiary education. In order to improve their writing skills, the authors propose the change of current teaching methodology in accordance with the results of a pilot application on students of secondary technical and vocational education. The proposed teaching method is reconfigured so that writing resembles computer programming in natural language, i.e. by using the concepts and processes of a subject that is common to all disciplines of science.
